Brass

Brass is a metal alloy of Copper and Zinc. Small additions of other alloying elements are added to modify the properties so that the resulting material is fit for a given purpose.

Brasses are medium strength engineering materials, comparable to high strength structural steels and some stainless steels and aluminium alloys. In the softened or annealed condition brasses are ductile and strong but when hardened by cold working their strength increases markedly. Brass has excellent machinability.

While brass may be less corrosion resistant than other copper alloys, its performance is quite adequate for many applications. However, brass tarnishes. Exposed to the atmosphere, it quickly forms a brown or graygreen protective corrosion film. Under certain conditions, brass can also dezincify. Dezincification is associated with submerged or stagnant exposure conditions, often in acidic media. Under atmospheric exposure, this form of corrosion is usually limited to superficial attack.

Typical applications include:

- Valves, pumps, shafts, fittings, and fasteners.
- Heat Exchangers Tubes
- Automotive Industry
- Marine Engineering
- Piping

Carbon Steel

Carbon steel, also called plain carbon steel, is a malleable, ironbased metal containing carbon, small amounts of manganese, and other elements that are inherently present. It is the most widely used engineering material, and accounts for approximately 85%, of the annual steel production worldwide.

Despite its relatively limited corrosion resistance, carbon steel is still used in large tonnages in numerous industrial applications.

Typical applications of Carbon Steel are:

- Pipeline Systems
- Mining
- Metal Processing Equipment
- Transportation
- Fossil Fuel Power Plants
- Petroleum Production & Refining

Typical Composition ASTM A105

Stainless Steel 316/316L

Stainless Steels 316/316L are austenitic grades and two of the most used alloys in a variety of industrial applications. The molybdenum addition gives this grade good resistance to general corrosion and provides increased strength at elevated temperatures. The austenitic structure also gives these grades excellent toughness, even at cryogenic temperatures. Grade 316L, the low carbon version of 316, minimizes harmful carbide precipitation due to welding.

It is common for 316 and 316L to be stocked in 'Dual Certified' form. These items have chemical and mechanical properties complying with both 316 and 316L specifications.

The corrosion resistance of stainless steel grades 316/316L is excellent in a wide range of atmospheric environments and many corrosive media. However, it is subjected to pitting and crevice corrosion in warm chloride environments, as well as to stress corrosion cracking.

Initially developed for use in paper mills, 316/316L stainless steel is typically used in the following applications:

- Food processing equipment
- Brewery equipment
- Chemical and petrochemical equipment
- Laboratory equipment
- Boat fittings
- Chemical transportation containers
- Heat exchangers
- Nuts and bolts
- Springs
- Medical implants
- General Service Process Equipment

Duplex Stainless Steel

Austenitic-Ferritic stainless steels, also called duplex stainless steels, were developed more than 70 years ago in Sweden for the paper industry in order to combat corrosion problems caused by chloride-bearing cooling waters and other aggressive chemical process fluids.

Due to the high content of chromium, nitrogen, and molybdenum, these steels offer good resistance to localised and uniform corrosion. The duplex microstructure contributes to the high mechanical strength, good abrasion, erosion and fatigue resistance. Duplex steels also possesses good weldability properties.

Typical applications of duplex stainless steel are:

- Pulp and paper industry
- Components for structural design
- Storage tanks
- Cargo tanks and pipe systems in chemical tankers
- Water heaters
- Flue-gas cleaning
- Heat exchangers

Refer to page 9 for product availability.

Super Duplex Stainless Steel

First used in the 1980s, Super-Duplex refers to highly alloyed, high performance Duplex stainless steel with a improved pitting and crevice corrosion resistance.

Super duplex steels were designed for specific applications where both high mechanical strength and good corrosion resistance are required.

Super Duplex Stainless Steel is noted for its high level of chromium, which gives the alloy excellent resistance to acid chlorides, acids, caustic solutions and other harsh environments.

Typical applications of super duplex stainless steel are:

- Desalination plants
- Heat exchangers
- Pollution control
- Pulp and Paper industry
- Tube & Pipe systems for petrochemical refineries
- Downhole

Typical Composition

Alloy 400

Alloy 400, also known as Monel[™], is a nickel-copper alloy, resistant to sea water and steam at high temperatures as well as to salt and caustic solutions. The alloy possesses excellent corrosion resistance in a wide variety of media and is also characterized by good weldability and moderate to high strength.

The alloy has been used in a variety of applications. It has excellent resistance to rapidly flowing brackish water or seawater. It is particularly resistant to hydrochloric and hydrofluoric acids when they are de-aerated. Indeed, it is one of few metallic materials which can be used in contact with fluorine, hydrofluoric acid, hydrogen fluoride and their derivatives.

The alloy is widely used in the chemical, oil and marine industries. Good mechanical properties from sub-zero temperatures up to 1020 °F.

Typical applications include:

- Valves, pumps, shafts, fittings, and fasteners, especially in marine environment
- Chemical and hydrocarbon
 processing equipment
- Crude oil distillation towers
- Gasoline and freshwater tanks
- Seawater Handling Equipment

Super Austenitic 6Mo

Super austenitic stainless steel 6Mo is a high performance alloy designed specifically for added corrosion resistance. It has the same structure as the common austenitic alloys, and greater levels of elements such as chromium, nickel, molybdenum, copper, and nitrogen, which gives it enhanced strength and corrosion resistance.

6Mo is especially suited for highchloride environments such as brackish water, seawater, pulp mill bleach plants, and other highchloride process streams. It is often used as a replacement in critical components where alloy 316/316L has failed by pitting, crevice attack, or chloride stress corrosion cracking. In many applications, the super austenitic stainless steels have been found to be a technically suitable and much more cost-effective alternative than nickel-base alloys.

Typical Composition

Typical applications of this alloy are:

- Seawater Handling Equipment
- Pulp Mill Bleach Systems
- Tall Oil Distillation Columns
 and Equipment
- Chemical Processing Equipment
- Food Processing Equipment
- Desalination Equipment
- Flue Gas Desulfurization Scrubbers
- Oil and Gas Production Equipment

Why selecting Steel 6Mo grade over Steel 316 grade?

- For all those applications which involve moderate to high chloride presence.
- For those applications in which 316 has failed or is likely to fail due to pitting, crevice or induced stress corrosion cracking.
- For those applications that require compliance to NACE standards and the existing 316 range can not meet such demand.
- For NACE equipment in processes over 60 °C, where 316 is not permitted.

Parker Hannifin carried out Stress Corrosion Cracking Testing as per ASTM G48 conducted by an independent party that determined the time to failure of 6Mo to be 3 times higher of that of 316. In service applications, those results translate into a life expectancy of 6Mo three times longer than that of 316 in the same given conditions, reducing leakage and downtime and increasing safety by over 60%.

Why selecting Steel 6Mo grade over Super duplex grades?

- Choose 6Mo for improved corrosion resistance and super duplex for increased strength. The higher strength of super duplex grades can make this material more susceptible to stress corrosion cracking under certain conditions.
- For those applications that are likely to suffer from pitting corrosion. The pitting resistance given by the PREN or Pitting Resistance Equivalent Number is higher for 6Mo than for its super duplex counterparts.

6Mo is one of our best-seller materials. It has been successfully used in a wide range of applications in the North Sea, Middle East, Mexico Gulf or Australia. Typical applications cover offshore platforms, heat exchangers or desalination plants. **Tubing Specification:** High Quality, Fully Annealed, Super Stainless Steel Tubing to ASTM A269/A213 Grade UNS S31254. Recommended Tube Hardness 80 HRB. Maximum Permissible Hardness 90 HRB.

Alloy 825

Alloy 825 is a nickel-ironchromium alloy with additions of molybdenum, copper, and titanium. The alloy is designed to provide exceptional resistance to many corrosive environments. Alloy 825 is resistant to corrosion in many acids and alkalis under both oxidising and reducing conditions, including sulphuric, sulphurous, phosphoric, nitric and organic acids, alkalis such as sodium or potassium hydroxide, and aqueous chloride solutions. High nickel content gives the alloy virtual immunity to stress corrosion cracking and good resistance to pitting and crevice.

Alloy 825 is a versatile general engineering alloy that exhibits good mechanical properties at both room and elevated temperatures (over 1000 °F).

Typical applications include:

- Chemical processing
- Pollution control
- Oil and gas recovery
- Acid production
- Nuclear fuel reprocessing

Alloy 625

This alloy has outstanding resistance to pitting and crevice corrosion as well as good resistance to intergranular attack. It also is almost totally resistant to chloride-induced stress corrosion cracking. With these properties the alloy has extremely high resistance to attack by a wide range of media and environments including nitric, phosphoric, sulphuric and hydrochloric acids, as well as alkalis and organic acids in both oxidising and reducing conditions. Alloy 625

has virtually no corrosive attack in marine and industrial atmospheres with extremely good resistance to seawater, even at elevated temperatures.

It is an excellent choice for applications that require high corrosion-fatigue strength or high tensile strength applications, creep and rupture strength and weldability.

Typical applications include:

- Sour Gas Service
- Engine exhaust systems
- Fuel and Hydraulic Lines
- Distillation columns and chemical transfer lines
- Nuclear water reactors

Alloy 625 is one of our best seller materials. It is one of the preferred alloy in a wide range of sour gas applications.

Alloy C276

Allov C-276 is known for its excellent resistance to a wide variety of chemical process environments, including strong oxidizers such as ferric and cupric chlorides, hot contaminated media, chlorine, formic and acetic acids, acetic anhydride, and seawater and brine solutions. Alloy C-276 alloy has excellent resistance to pitting and to stress-corrosion cracking. It is also one of the few materials that withstands the corrosive effects of wet chlorine gas, hypochlorite, and chlorine dioxide. Alloy C-276 can resist the formation of grain boundary precipitates in the weld heat-affected zone, making it also a common candidate for most chemical and petrochemical

processing applications in the aswelded condition.

This alloy might be used in any environment that requires resistance to heat and corrosion but where the mechanical properties of the metal must be retained.

Typical applications include:

- Chemical processing
- Air Pollution control
- Pulp and Paper Production
- Marine Engineering
- Waste Treatment

Refer to page 9 for product availability.

Titanium Grade 2

Titanium is virtually immune to environmental attack. It withstands urban pollution, marine environments, the sulphur compounds of industrial areas and is failure-proof in even more aggressive environments. The uses for titanium in industry are growing faster than ever before as more and more engineers are discovering it can reduce lifecycle costs across a broad range of equipment and processes. Titanium has an exceptionally high strength to weight ratio, allowing for lighter components or reduced wall thicknesses. Any remaining higher up front costs are almost always recouped in multiple due to increased production time and reduced maintenance.

Titanium forms a very tenacious surface oxide layer, which is an

outstanding corrosion inhibitor. In many harsh environments it can outlast competing materials as much as 5 times longer. Lower failure rates translate to less downtime, reduced maintenance and total lower cost.

Typical applications include:

- Chemical processing
- Power Generation
- Aerospace and Defence
- Petrochemical Refineries
- Desalination Plants

Carbon	0.08 max		
Hydrogen	0.015 max		
Iron	0.4 max		
Oxygen	0.2 max		
Aluminium	5.5 to 6.75		
Vanadium	3.5 to 4.5		
Titanium	Remainder		

Typical Specifications		
Product	Standard	
Bar	ASTM B348	
Plate	ASTM B265	
Forging	ASTM B381	
Tube	ASTM B338	
Other	NACE MR0175	
UNS No.	R50400/56400	

Refer to page 9 for product availability.

Tubing Specification: High Quality, Fully Annealed, Titanium Tubing to ASTM B338 Grade 2 UNS R50400. Recommended Tube Hardness 75 HRB. Maximum Permissible Hardness 85 HRB.

Table 13	Titanium Grade 2			Imperial
Tube	Wall Thickness, inches			
O.D. Size	0.028	0.035	0.049	0.065
1/4	3300	4200	6200	
3/8		2700	4000	5400
1/2		2100	3100	

Working pressure is measured in 'psig'

Not recommended for gas service

Recommended for all services - standard assembly

Recommended for all services - Use pre-assembly tool

No data/Not recommended/No solution

Table 14	Titanium Grade 2			Metric	
Tube	Wall Thickness, mm				
O.D. Size	0.8	1	1.2	1.5	
6	280	350	440		
10		200	250	320	
12		170	200		

Suparcase[™] for A-LOK[®] Back Ferrules

The first step in ensuring the integrity of any system is to choose the right materials for the job. That's why Parker supply fittings in a wide range of exotic materials for applications where corrosion is an issue, and where new, harder materials for tubing for high-integrity applications are being used.

The Suparcase[™] PRINCIPLE

The Parker Suparcase[™] surface treatment is an unique process that allows stainless steels and other alloys to be hardened without affecting, and even increasing, the corrosion resistance of the given materials. Parker has been using the proprietary Suparcase process to surface harden stainless steel ferrules for approximately 20 years. The process achieves a carbon supersaturated surface layer by altering the oxide passive layer on the surface of the stainless steel, without any detrimental effects.

Good Tube Grip = Harder Rear Ferrule = Smarter, Faster, Cleaner, Safer

- Suparcase[™] process perfected by Parker gives the Differential Hardness
- Some competitor hardening process corrode (i.e. Nitride or Edge Hardening)
- Suparcase[™] increases the corrosion resistance
- Suparcase[™] is applied to all back ferrules, all sizes

A-LOK[®] body. Includes precision machined threads and burnished cones for enhanced sealing. Materials sourced only in Western Europe to ensure quality capable of performing in the most harsh process environments. Includes material & HCT identification.

A-LOK[®] front ferrule. Precision machined to seal every time. Includes material identification.

A-LOK[®] nut with silver plated threads for lubrication. Outer shoulder is rollmarked with the Parker name, size and material identification.

A-LOK[®] precision machined back ferrule. Parker were the first to Suparcase[™] harden the back ferrule and lead the world for outstanding corrosion resistance and superior grip. Includes material identification.

Suparcase[™] Advantages

The result is a thin surface region supersaturated with carbon in solid solution. This surface region has some unusual advantageous properties:

Improved Hardness

Hardness Test – Suparcased samples are at least 250% harder than their untreated counterparts.

- Increased Fatigue Strength Bending Test – Suparcased samples showed 50% increase in fatigue strength with respect to the same untreated samples under the same number of cycles.
- No change in shape, size or colour
- Suparcase Layer does not crack or delaminate during forming

Outstanding Wear and Erosion Resistance

Wear Test performed on a high pressure homogenizer made out of Stainless Steel 316 – The Suparcase[™] samples increased the wear & erosion resistance by 13 times in air and by 10 times in seawater with respect to their untreated counterparts.

Exceptional Corrosion
 Resistance

ASTM G48 - Standard Test Methods for Pitting and Crevice Corrosion Resistance of Stainless Steels and Related Alloys by Use of Ferric Chloride Solution. Test Results on Type 316 Suparcased™ stainless steel:

Condition	ASTM G 48 Ferric Chloride Test Results
As-machined (Cold Worked)	6.1% weight loss
As-machined + Suparcase™	0.0% weight loss
Annealed + Suparcase [™]	No corrosion

Suparcased Rear Ferrule

Nitride hardened Rear Ferrule

ASTM G150 Critical Pitting Temperature. CPT measures the temperature at which pitting is likely to start:

Alloy	UNS Number	CPT Range - °C
316	S31600	0 - 30
317L	S31703	32 - 45
904L	N08904	30 - 55
316 Suparcase™	S31600	69 - 75
6Mo	S31254	70 - 90
